

IN THE PREP ROOM

1. Always use NeutrOlene when cleaning the embalming table after completing a case.
2. Use as a cleansing additive when washing a body...and add NeutrOlene to shampoo.
3. For cases of uremic poisoning, early decomposition or other conditions where offensive bodily odors are present, add NeutrOlene, based on embalming analysis to embalming fluid to neutralize these internal odors.
4. Wipe down Personal Protective Equipment with NeutrOlene after every use.
5. Add NeutrOlene to body wash when showering after cases are completed.
6. Because organic odors permeate any material quickly, use NeutrOlene regularly to neutralize odors in First Call vehicles, family cars and funeral cars.
7. Spray shoes worn during preparation at the end of the day -- inside and out -- to prevent transmission of any organic or chemical odors.
8. On ship-outs, spray body bag well with NeutrOlene, if one is used, and liberally sprinkle NeutrOlene granules in the bottom of the shipping container.
9. Spray biohazard bags liberally.
10. Use NeutrOlene spray in the decedent's mouth before setting the features to avoid any future odors.

Neutrolene Odor Neutralizers

11. If decubitus ulcers are present, spray packing and then spray bandage with NeutrOlene to prevent odors.
12. For autopsied cases, remove and soak viscera. Sprinkle cavity with paraformaldehyde and NeutrOlene granules to absorb liquids. Then replace viscera, suture, bandage and spray with NeutrOlene.
13. Bandage autopsy incisions and spray with NeutrOlene
14. Use a NeutrOlene Hang in refrigeration area to prevent odor build-up and in medium-to large prep rooms (up to 600 square feet).
15. Hallways -- especially interior hallways without ventilation --will capture and retain odors so quickly, they are difficult to detect. Spraying NeutrOlene in these areas regularly will keep area "air neutral."
16. When replacing filters, spray new one's with NeutrOlene to avoid any odors accumulating in the vents.
17. Pour Neutrozyme RTU drain treatment down every drain in the prep room to clear bacteria and neutralize any odors coming from the drainage system. Then flush and spray with NeutrOlene.
18. After every case, add Neutrolene when cleaning embalming tools and other instruments used in preparation.
